Abstract

We present a methodology for mapping relational database management systems (RDBMS) based on the hypertext model GHMI that we are developing. Applying hypertext functions to the effectiveness of RDBMS for users. We illustrate the domain mapping between RDBMS and a bridge law examples which map database objects to GHMI components, and database operations to GHMI links. We also describe our GHMI prototype. Hypertext can provide a database features to RDBMS in a powerful and flexible way

Abstract

This paper discusses the integration of hypermedia as a value-added support functionality into computer-based information systems. These include a large base of scientific and business applications, which people use primarily for their underlying analytic functionality. Hypermedia features supplement these applications, providing access to the application's primary activities, and support for the understanding of information and communication between team members. This paper presents a topography for the emerging hypermedia functionality research in general. It also illustrates one branch of this research with an example: an information system level functionality within a software system with the emphasis on hand-made hyperlinks and annotations.

Abstract

The Distributed Link Service, a distributed system of link services for the World Wide Web [Carr et al 95, Carr et al 96], has been used to impose configurable navigation structures upon suites of static document resources in the World-Wide Web. This paper describes the integration of the link service functionality into a Web proxy server, and examines the implications for the service's user interface in terms of including, representing, discriminating, prioritising and traversing links.
